

**Gamma-ray
Bursts
(GRBs)**

**Bljeskovi/Eksplozije
gama-zračenja**

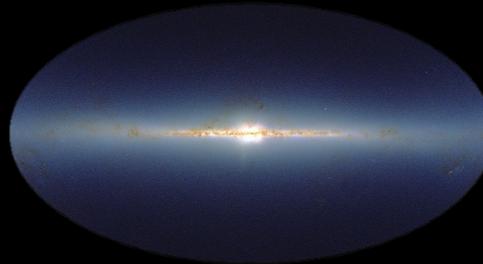

Autor: Miloš Kovačević

Iz posmatračkog ugla

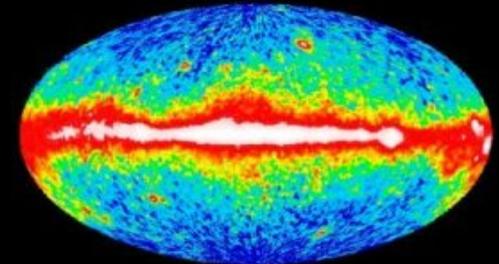

Naša galaksija

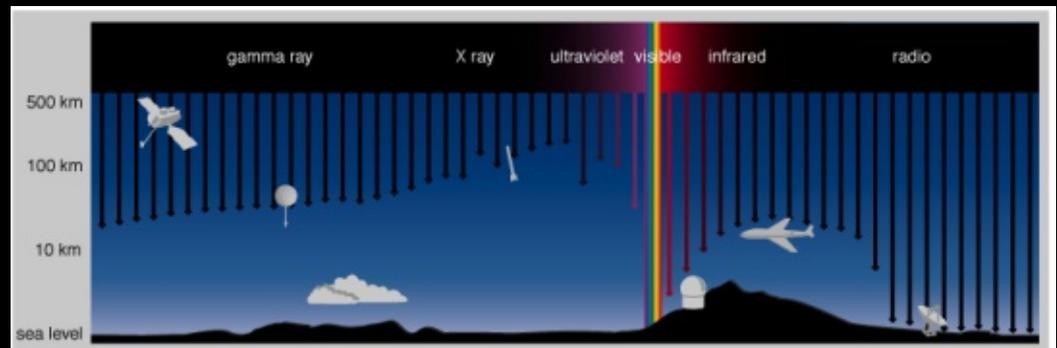

Nebo u 2D (u galaktičkim koordinatama)

infracrveno-optički

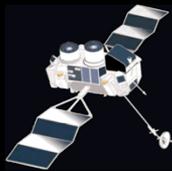

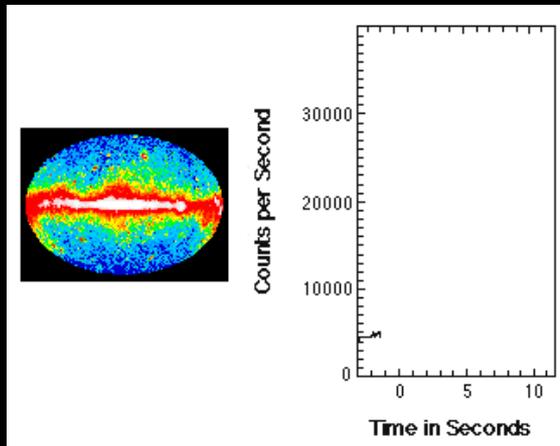

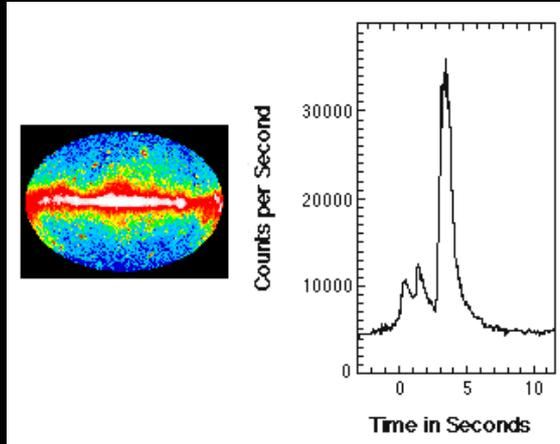

gama

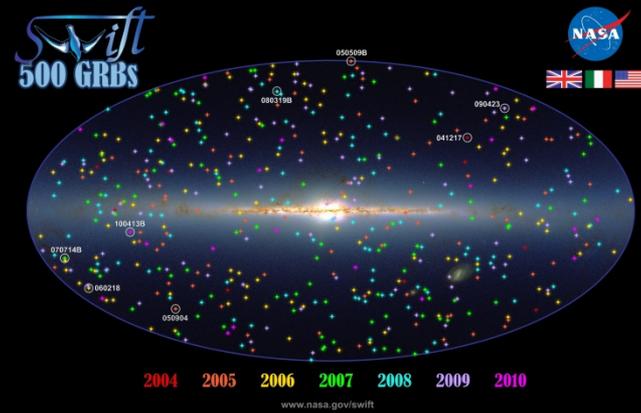

Transparentnost Zemljine atmosfere

Iz posmatračkog ugla

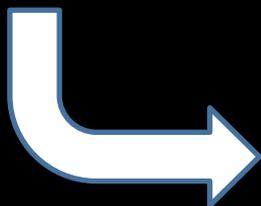

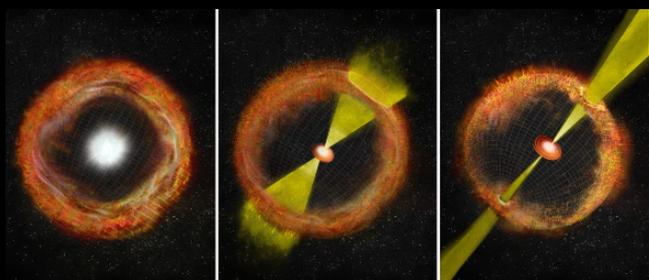

CGRO-BATSE (1991 – 2000)

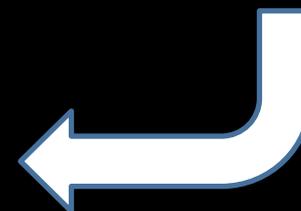

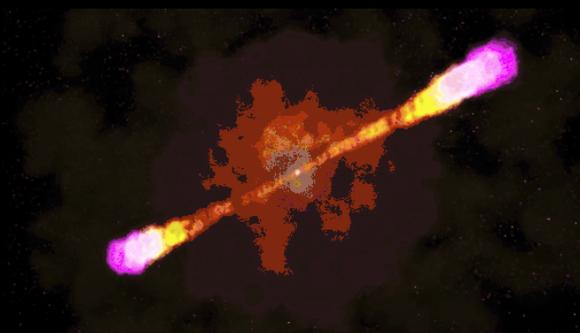

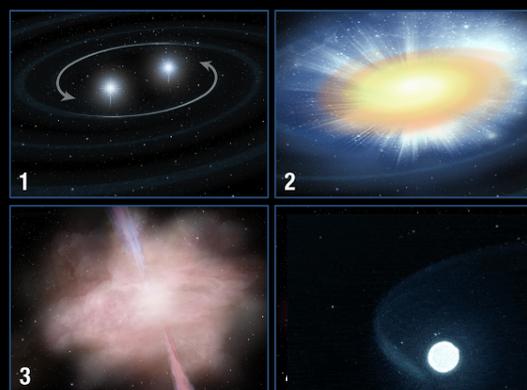

Swift-BAT (2004 – 2018...)
1 GRB svaka 3 dana

Kako nastaju?

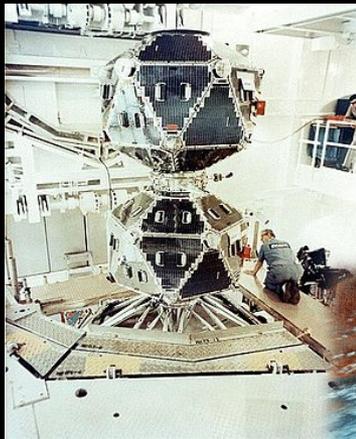

Kraj života masivne zvezde
> GRB & hipernova (jaka supernova)

Sudar dve neutronske zvezde
> GRB & kilonova (slaba supernova)

Vela sateliti

12 satelita sa X i gama detektorima lansiranih u periodu 1963 – '70 (SAD)

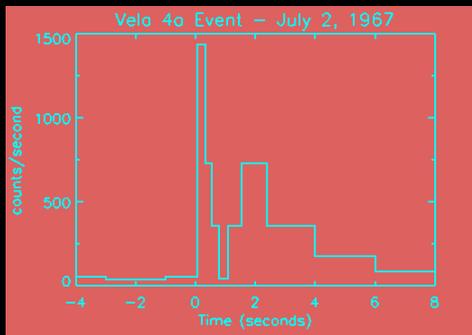

Internacionalni dogovor o smanjenu nuklearnih testova

Partial Nuclear Test Ban Treaty

potpisan 1963. izmedju, pre svega, SAD i SSSR.

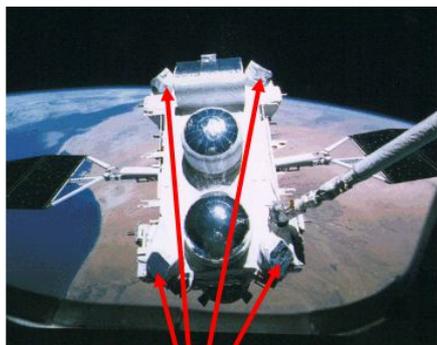

Prvi detektovani GRB
1967. godine (deklasifikovani 1973.)

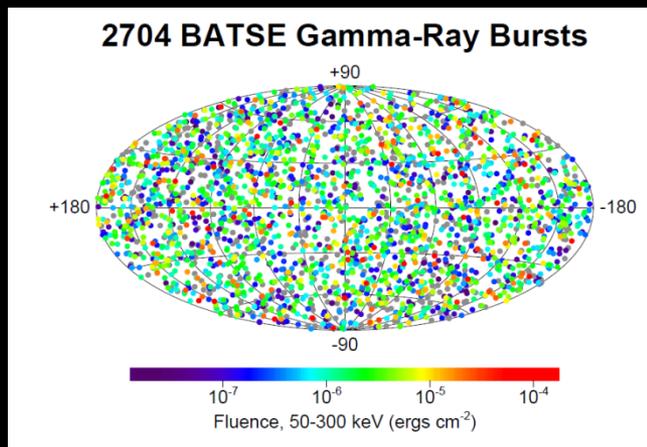

CGRO satelit: *BATSE* detektor(i)...

Compton Gamma-Ray Observatory: Satelit sa X i gama detektorima (1991 – 2000; NASA)

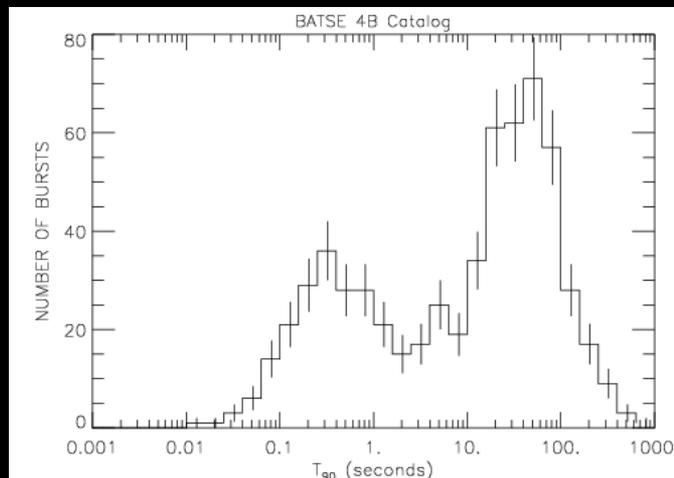

BATSE (Burst and Transient Source Experiment) on the Compton Gamma-Ray Observatory

BATSE: 1 GRB dnevno; lokalizacija 2°-3°; pokriva celo nebo

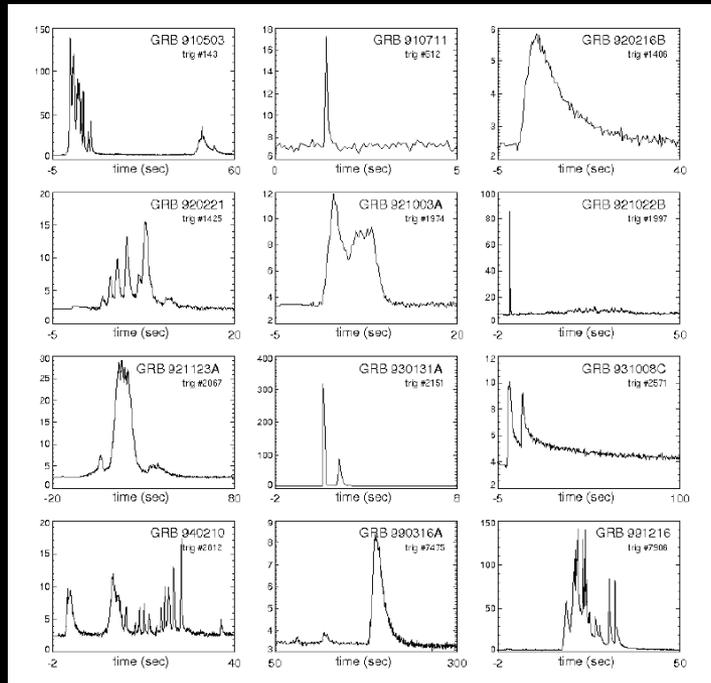

Izotropnost pozicija na nebu
→ vangalakticki objekti

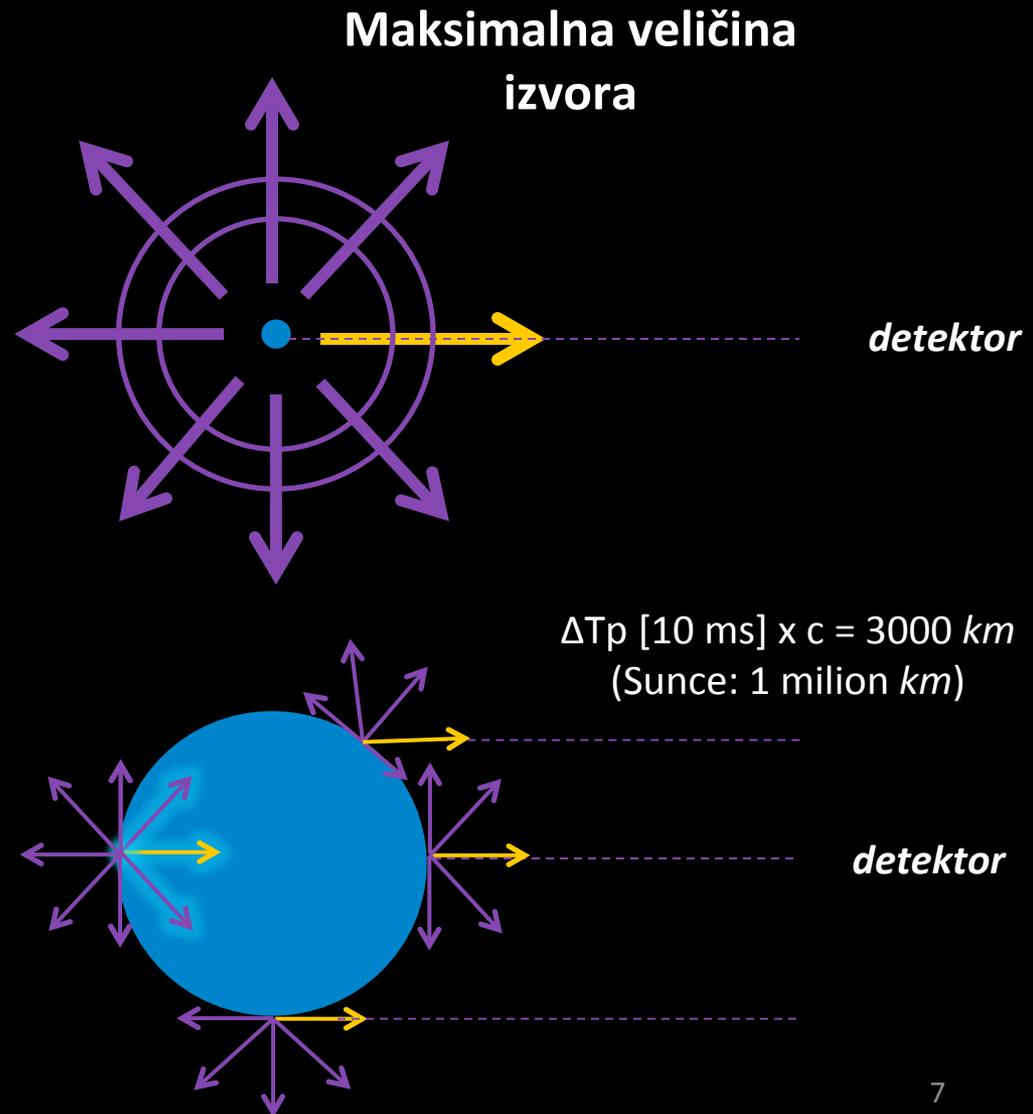

Dužina trajanja GRB
Dve fele: kratki i dugi;
granica oko 2s.

Grupe se razlikuju i po spektru, tj. energijama fotona

Profil

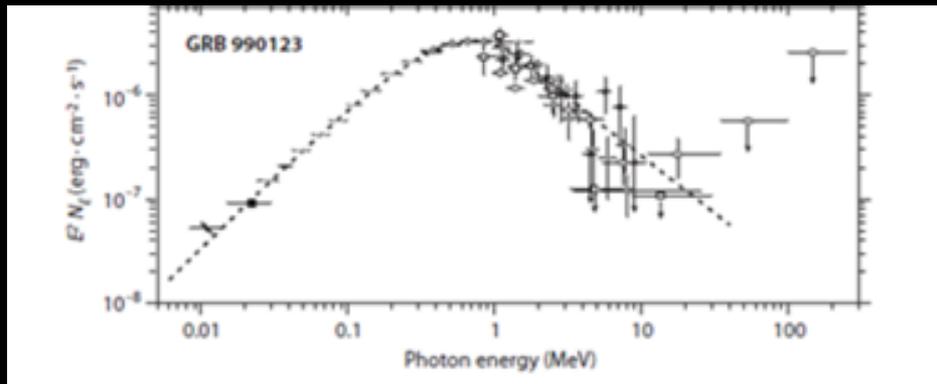

- **Primeri 12 GRB**
- **Svi različiti**
- **Pulsevita struktura (simetrični ili FRED)**
- **Bez periodičnosti (za razliku od npr. pulsara)**
- **$\Delta T_p = \dots 10 \text{ ms} - 10 \text{ s} \dots$**

Spektar

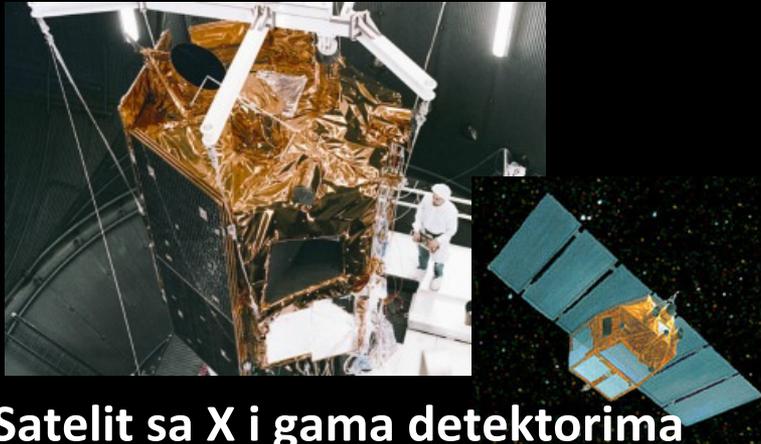

Spektar (BATSE i drugi detektori na CGRO)

- Spectral energy distribution
- Količina energije po energijskoj dekadi (gama, X, UV, O, IR, radio)
- Logaritamska skala
- Stepeni zakon → prava

- Band (dvostruki stepeni zakon – E^{stepen})
- Netermalni (nije crno telo) → zona zračenja transparentna/prozirna
- Maksimum u gama domenu
- Maksimum ide ka nižim energijama tokom trajanja jednog pulsa
- Maksimum je u proseku veći za kratke GRB nego duge

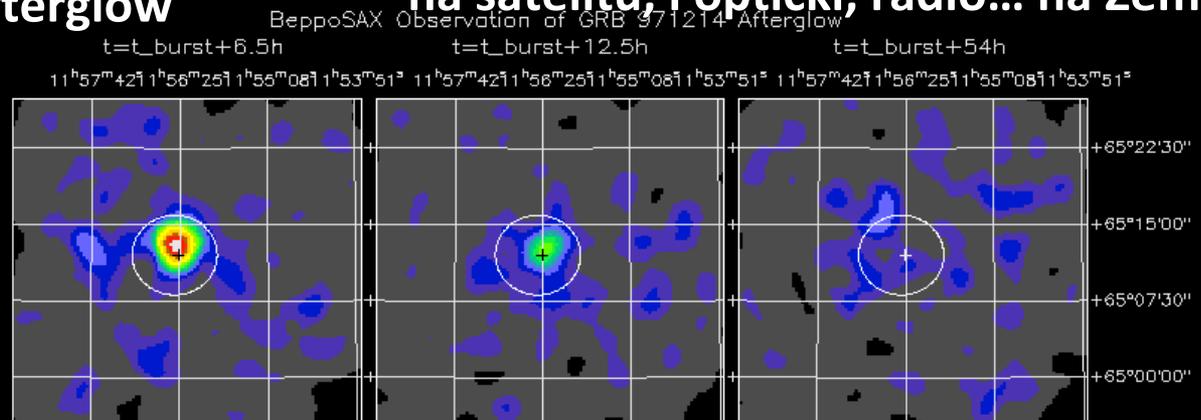

BeppoSAX satelit

Satelit sa X i gama detektorima
(1996 – 2002; Italija, Holandija)
WFC: pokriva deo neba $20^\circ \times 20^\circ$;
Lokalizacija GRB $5'$ [$1^\circ = 60'$]
X-teleskopi: detekcija afterglow

Afterglow/naknadni sjaj
(GRB 970228 – prvi put)

- Nakon glavne emisije
- Mnogo slabiji
- Traje danima
- Gama, X, O, mikro, radio – stepeni sp.
- Detektuju ga teleskopi (detektori fokusirani na deo neba); X-teleskopi na satelitu, i optički, radio... na Zemlji

Udaljenost

GRB 970228

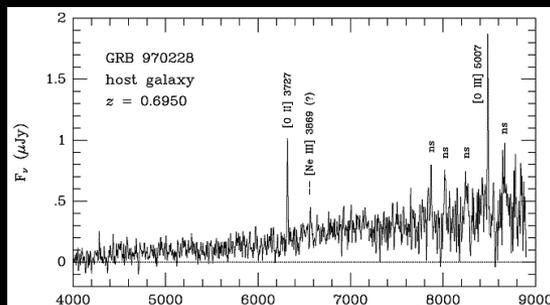

GRB u galaksijama
(van centra)

← spektralne linije

$z = 0.7$

8 milijardi svetlosnih godina

detektor

○ 1997 – 2018...

• Dugi GRB:

$z_{\min} < 0.01$ (100 miliona sv. god.)

• Kratki GRB:

$z_{\min} = 0.1$ (1 milijarda sv. god.) *

• GRB:

$z_{\max} = 8, 9$ (30 milijardi sv. god.)

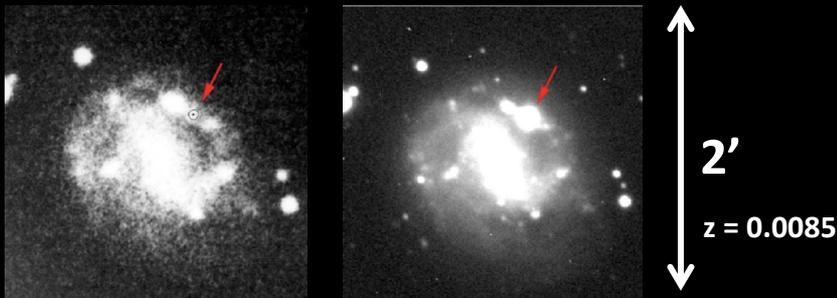

• Zemlja – Sunce: 8 sv. min.

• Najbliza zvezda: 4 sv. god.

• Mlecni Put: 100.000 sv. god.

GRB – Supernova veza

GRB 980425 – SN 1998bw
(prvi potvrđjeni par)

tokom GRB

SN
par dana kasnije

GRB nisu u centru galaksija
& povezani su sa SN
→ stelarni fenomeni
(kraj zvezde)
(za razliku od AGN/AGJ)

- 1998 – 2018...
20-50 potvrđenih parova
(energične SN tipa Ib/c)
- ❖ Samo dugi GRB:
 - $z_{\min} < 0.01$ (100 miliona sv. god.)
 - $z_{\max} = 1$ (1 milijarda sv. god.)
[ograničenost teleskopa]
 - GRB $E_{\text{iso}} = 10^{48} - 10^{54}$ erg
 - Pretpostavlja se da veliku većinu dugih GRB prati SN (hipernova)
- ❖ Kratki GRB:
makronova/kilonova
GRB 130603, GRB 170817

Energija

Fluks & udaljenost
& korekcije zbog širenja svemira
→ (izotropna) energija E_{iso}

GRB 970228: $E_{\text{iso}} = 10^{52}$ erg
[1J = 10^7 erg]

! E_{iso} - samo fotoni/EM-zračenje

○ 1997 – 2018...

• Dugi GRB:

$$E_{\text{iso}} = 10^{48} - 10^{55} \text{ erg}$$

• Kratki GRB:

$$E_{\text{iso}} = 10^{49} - 10^{53} \text{ erg}$$

GRB:

$$L_{\text{max}} = 10^{53,54} \text{ erg / s}$$

Koliko je 10^{54} erg?

$$M_{\text{sunce}} = 10^{30} \text{ kg} \xrightarrow{E = mc^2} 10^{54} \text{ erg}$$

Supernova
(neutronska zvezda)

$$E_{\text{tot}} = 10^{53} \text{ erg}$$

$$E_{\text{kin}} = 10^{51} \text{ erg}$$

$$E_{\text{ph}} = 10^{49} \text{ erg}$$

SN 2015L
(najintenzivnija SN ikad)

$$E_{\text{ph}} = 10^{52} \text{ erg}$$

tokom 4 meseca

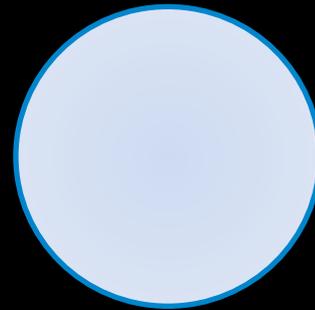

$$L_{\text{max}} = 10^{45} \text{ erg / s}$$

Compactness problem / kompaktnosti

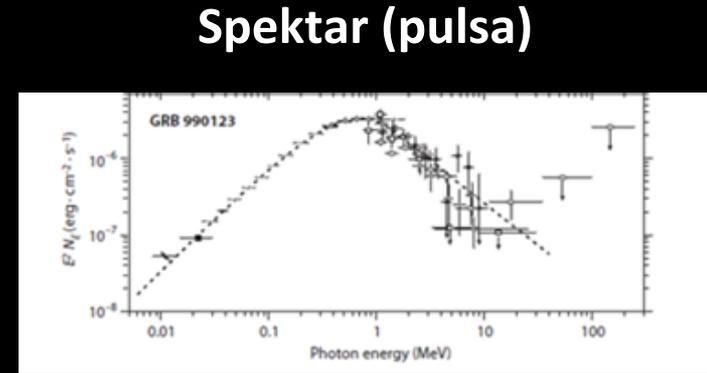

Kratak puls

Maksimalna
velicina izvora
→

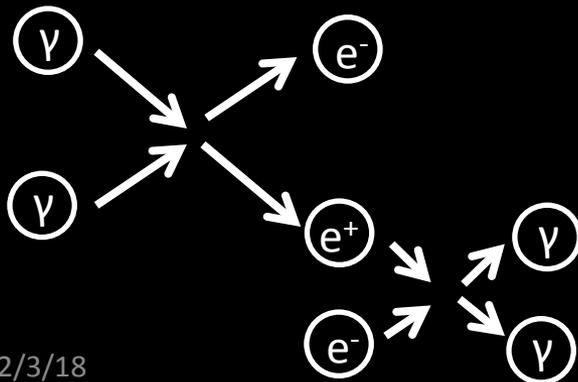

Transparentno ←

Broj fotona
(koncentracija)
 $E_\gamma > 0.5 \text{ MeV}$

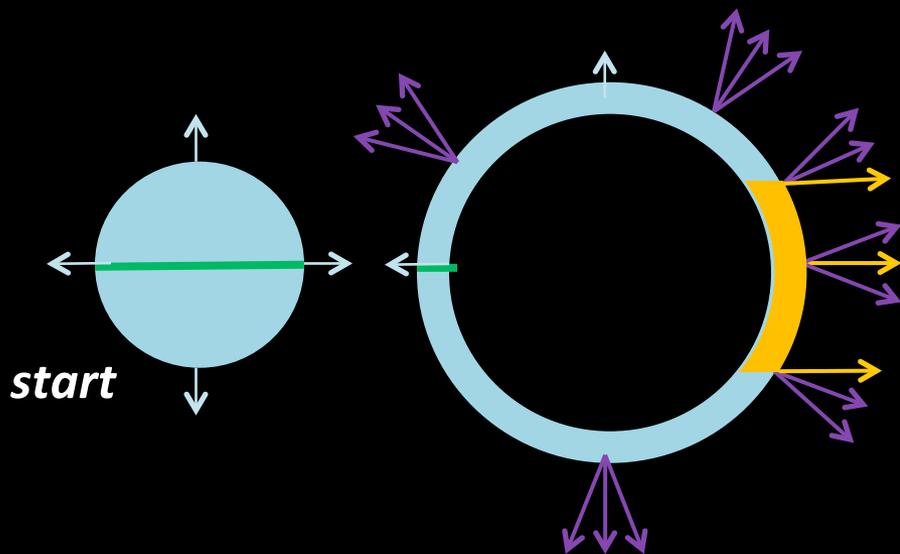

Spektar (pulsa)

E_{iso} (pulsa)

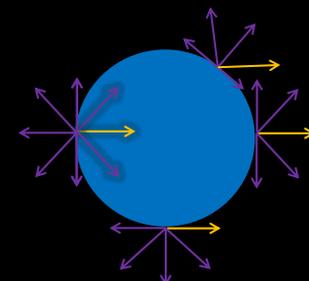

- foton-lepton plazma; optička gustina = 10^{15}
- Veoma netransparentno!
- Zračenje samo sa površine (dosta slabije)!
- Spektar crnog tela (termalni)!

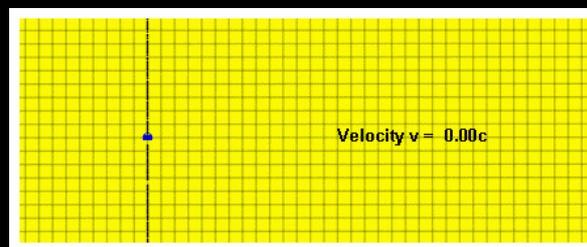

(Ultra)relativističko kretanje

Fokusiranje
zracenja

Staticki izvor

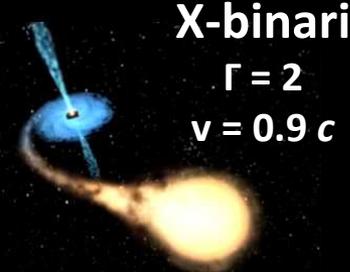

Photon boosting /
povećanje energije
fotona

optička gustina = 1 $\rightarrow \Gamma = 100, \Gamma_{\max} = 1000$
 $\Gamma = 1/$; $v = 0.9999, 0.999999 c$

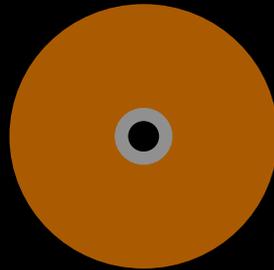

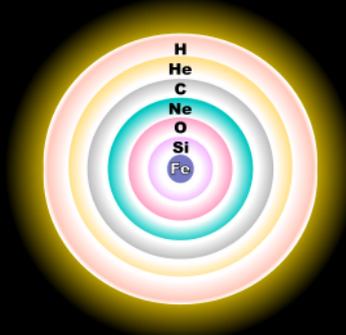

AGN/AGJ
 $\Gamma = 2-20$
 $v = 0.99 c$

X-binari
 $\Gamma = 2$
 $v = 0.9 c$

Crna rupa & jet/mlaz

Zvezda pre supernove

Gvozdeno jezgro,
 $R = 10.000 \text{ km}$ (+ rotacija)

(proto) Neutronska zvezda,
 $R = 30 \text{ km}$

Crna rupa, $R = 6 \text{ km}$ (+rotacija)

$$E_{\text{tot}} = 10^{53} \text{ erg}$$

$$(E_{\text{ph}} = 0.001 E_{\text{tot}})$$

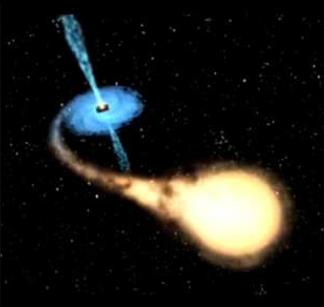

$$E_{\text{tot}} > 10^{53} \text{ erg}$$

$$(E_{\text{iso}} = 10^{54,55} \text{ erg})$$

AGN

X-binari

Akumuliranje materije na crnu rupu
 → jet-ovi/mlazevi

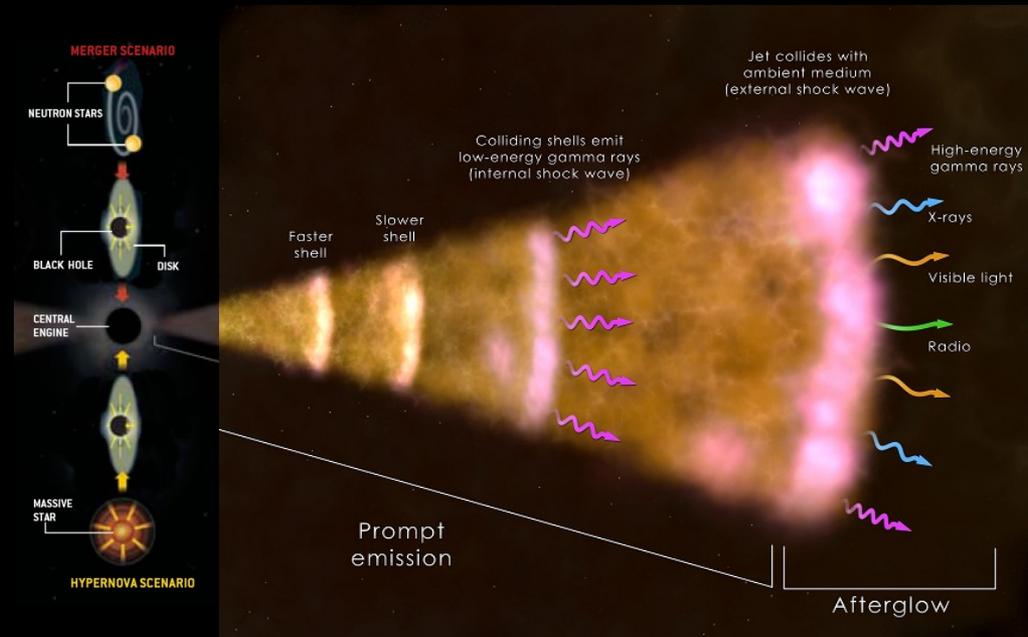

GRB

$$\Theta_j = \dots 3^\circ - 10^\circ \dots$$

$$\rightarrow E_{\text{ph}} = 0.01 E_{\text{iso}}$$

Fireball / vatrena lopta model

Afterglow:

- Kada se svi fireball-ovi spoje i sudare sa kontinualnim i retkim ISM ($r = 10^{11}$ km) (interstelarnim medijumom)
- Slabije zracenje koje traje danima u svim delovima spektra

$$R_{\text{sunce}} = 10^6 \text{ km}; c = 10^5 \text{ km/s}$$

Centralni motor:

- $E_{\text{tot}} = 10^{54}$ erg: neutrine + GW + niz Fireballs ($E_{\text{fbs}} = 10^{52}$ erg): foton-lepton-(malo)protona plazma
- $T_{\text{fb}} = 1 \text{ MeV}$
- $R_{\text{fb}} = 10\text{-}100 \text{ km}$

Fireball evolucija:

- Fokus u jet/snop \rightarrow deo sferne ljuske debljine R_{fb}
- $E_u \rightarrow E_k$ protona $\Gamma = 100$ ($r = 10^3 \text{ km}$); Fb se hladi
- Transparentnost ($r = 10^7 \text{ km}$); fotoni napuste Fb (mala E_{ph})
- Sudari dve fireball ($r = 10^9 \text{ km}$) \rightarrow Ubrzanje elektrona + magnetno p. \rightarrow sinhrotronsko zracenje ($E_{\text{ph}} = 10^{51}$ erg; netermalni s.) \rightarrow Usled fokusa $E_{\text{iso}} = 10^{53}$ erg

Swift & Fermi

○ Swift

- Satelit sa gama, X i UV detektorima (2004 – 2018...; NASA i drugi)

Brza i precizna lokalizacija

- GRB 050509b:

prva lokalizacija kratkog GRB

($z = 0.225$)

- Swift lokalizovao skoro sve kratke GRBs i vecinu dugih

○ Fermi

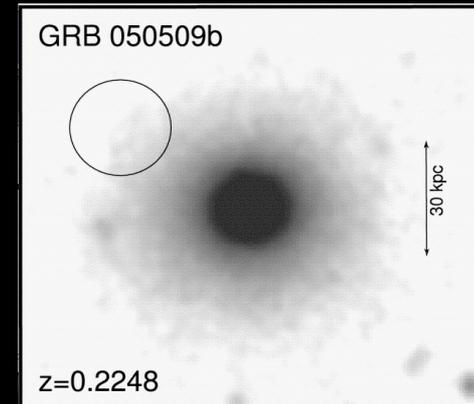

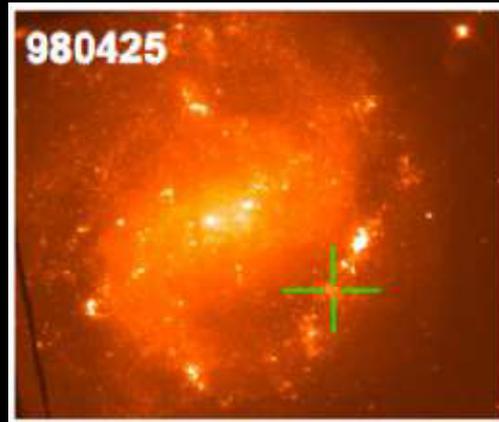

- Satelit sa gama i X detektorima (2008 – 2018...; NASA i drugi)

- Veliki energijski opseg

○ Sve je javno!

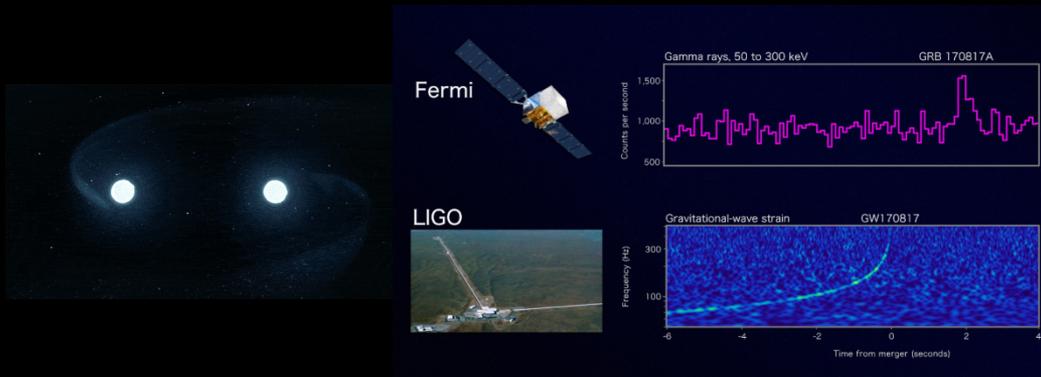

(sirovi podaci, katalozi, softver... na NASA serveru)

Lokacije dugih i kratkih GRBs u galaksijama

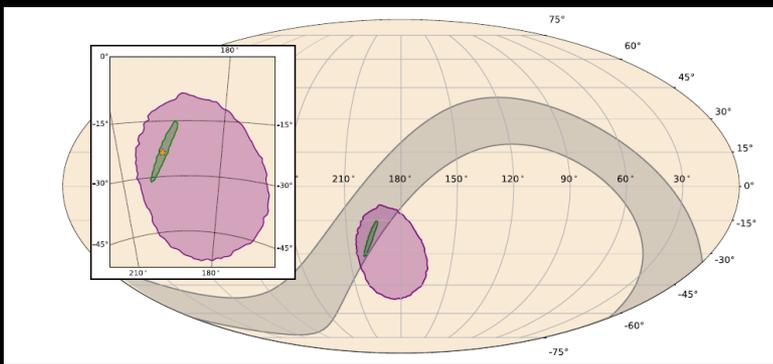

- **Galaksije dugih GRBs:**
 - nepravilne, patuljaste, spiralne - svetliji delovi
(star forming regions / regije s formiranjem zvezda)
 - Masivnije zvezde – kraće žive
→ Kraj života masivnih zvezda (+ Supernove tipa Ib/c)
- **Galaksije kratkih GRBs:**
 - Uglavnom elipticne (starije)
 - Bez preferencije mesta
 - Poneki veoma udaljeni od centra
→ Stare zvezde
→ Sudari 2 neutronske zvezde (+ kilonova, odsustvo regulrane SN)

GW 170817 - GRB 170817

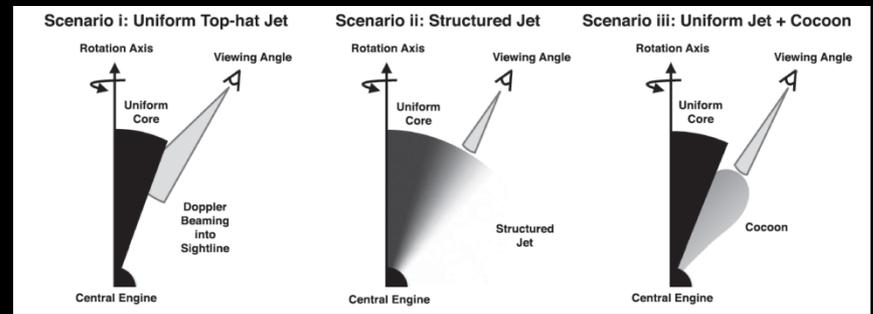

- 2 *LIGO* i *Virgo* GV detektori: signal 100s; 2015 – 2018... 7 GV, prvi put 2 NS ($85 < d < 160 \text{ M}_{\text{Sun}}$)
- 2s nakon kraja GV *Fermi-GBM* kratki GRB
- 11 sati nakon opticka detekcija → Galaksija $d = 130 \text{ M}_{\text{Sun}}$ ($z = 0.01$)
- kilonova

- GRB: $z = 0.01$ ($z_{\text{min}} = 0.1$);
 $E_{\text{iso}} = 10^{46,47}$ ($E_{\text{iso, min}} = 10^{49}$) erg

{Abbott et al (2017), ApJ}

X, radio posmatranja i dalje traju
