Super-strong Magnetic Field in Sunspots

Takenori J. Okamoto¹ and Takashi Sakurai

National Astronomical Observatory of Japan, Mitaka, Tokyo 181-8588, Japan; joten.okamoto@nao.ac.jp

Received 2017 August 1; revised 2017 December 12; accepted 2017 December 22; published 2018 January 4

Abstract

Sunspots are the most notable structure on the solar surface with strong magnetic fields. The field is generally strongest in a dark area (umbra), but sometimes stronger fields are found in non-dark regions, such as a penumbra and a light bridge. The formation mechanism of such strong fields outside umbrae is still puzzling. Here we report clear evidence of the magnetic field of 6250 G, which is the strongest field among Stokes I profiles with clear Zeeman splitting ever observed on the Sun. The field was almost parallel to the solar surface and located in a bright region sandwiched by two opposite-polarity umbrae. Using a time series of spectral data sets, we discuss the formation process of the super-strong field and suggest that this strong field region was generated as a result of compression of one umbra pushed by the horizontal flow from the other umbra, such as the subduction of the Earth's crust in plate tectonics.

Key words: Sun: magnetic fields – Sun: photosphere – sunspots

1. Introduction

Sunspots are concentrations of magnetic fields on the solar surface. Their strong magnetic field controls the physical conditions in and around sunspots and produces various kinds of structures. For example, a sunspot usually consists of the umbra with a vertical magnetic field and the penumbra with a

As the strongest magnetic field ever reported, van Noort et al. (2013) showed \sim 7500 G in a sunspot penumbra with the complex inversion technique. Although the proper motion of sunspots or flows in light bridges and penumbrae might contribute to the enhancement of horizontal fields, there is no convincing explanation about the formation mechanism of these strong fields. The origin and behavior of strong fields are

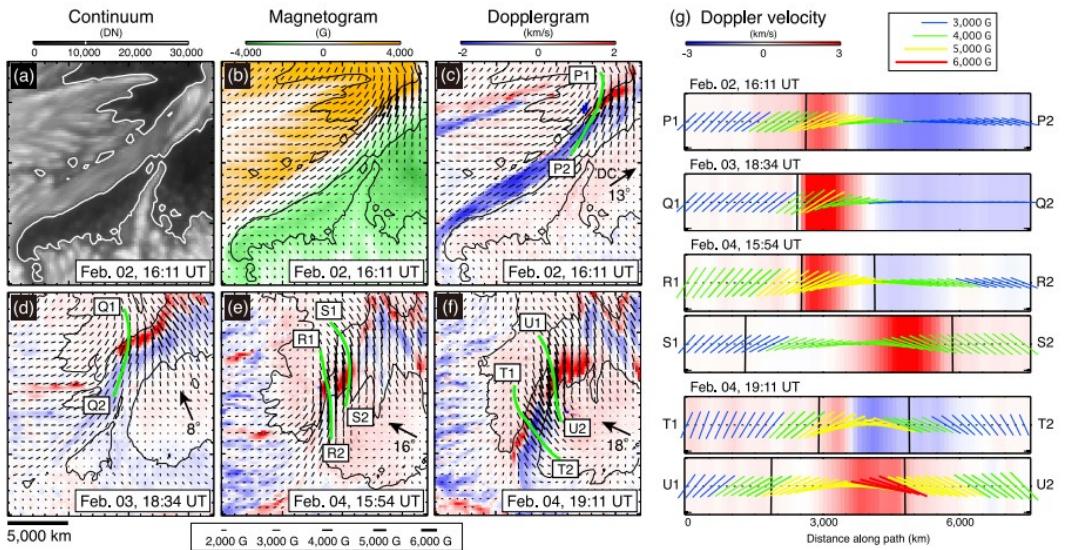

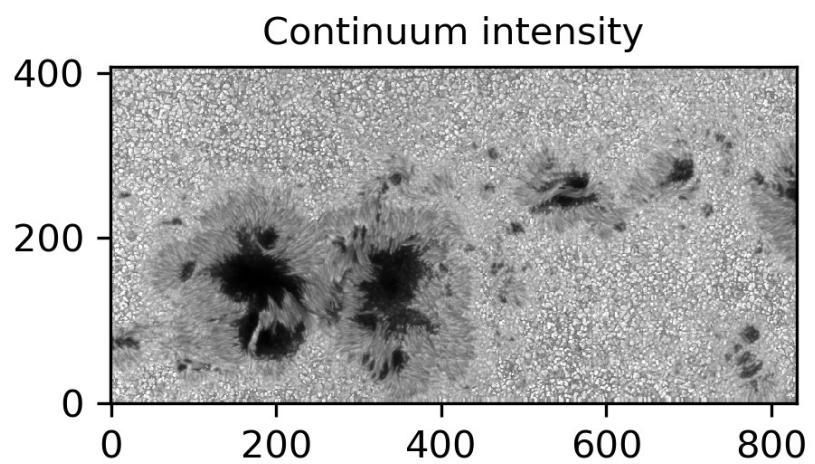

Figure 3. Vector magnetic fields and Doppler velocities in the sunspot region. (a) A continuum map. The white contours indicate the boundary of the umbrae. The same contours are also drawn in black in (b) and (c). (b) A vector magnetogram. The color background (orange for positive and green for negative polarities) and the black bars show the vertical and the horizontal components of the magnetic field in the solar local frame, respectively. (c)–(f) Time series of Doppler (line-of-sight) velocity maps (blue and red mean velocities toward and away from us). Velocities exceeding $\pm 2 \text{ km s}^{-1}$ are saturated. The black bars are the horizontal magnetic fields as in (b). Panels (a)–(c) correspond to frame 3 of Figure 2, while panels (d)–(f) correspond to frames 5, 7, and 8, respectively. Each panel shows the direction of and the angular distance to the disk center at the center of the field of view. (g) Horizontal profiles of vector magnetic fields and Doppler velocities along the green paths shown in (c)–(f). These green paths are drawn along the horizontal magnetic field vectors. The background color (from blue to red) indicates Doppler velocities.

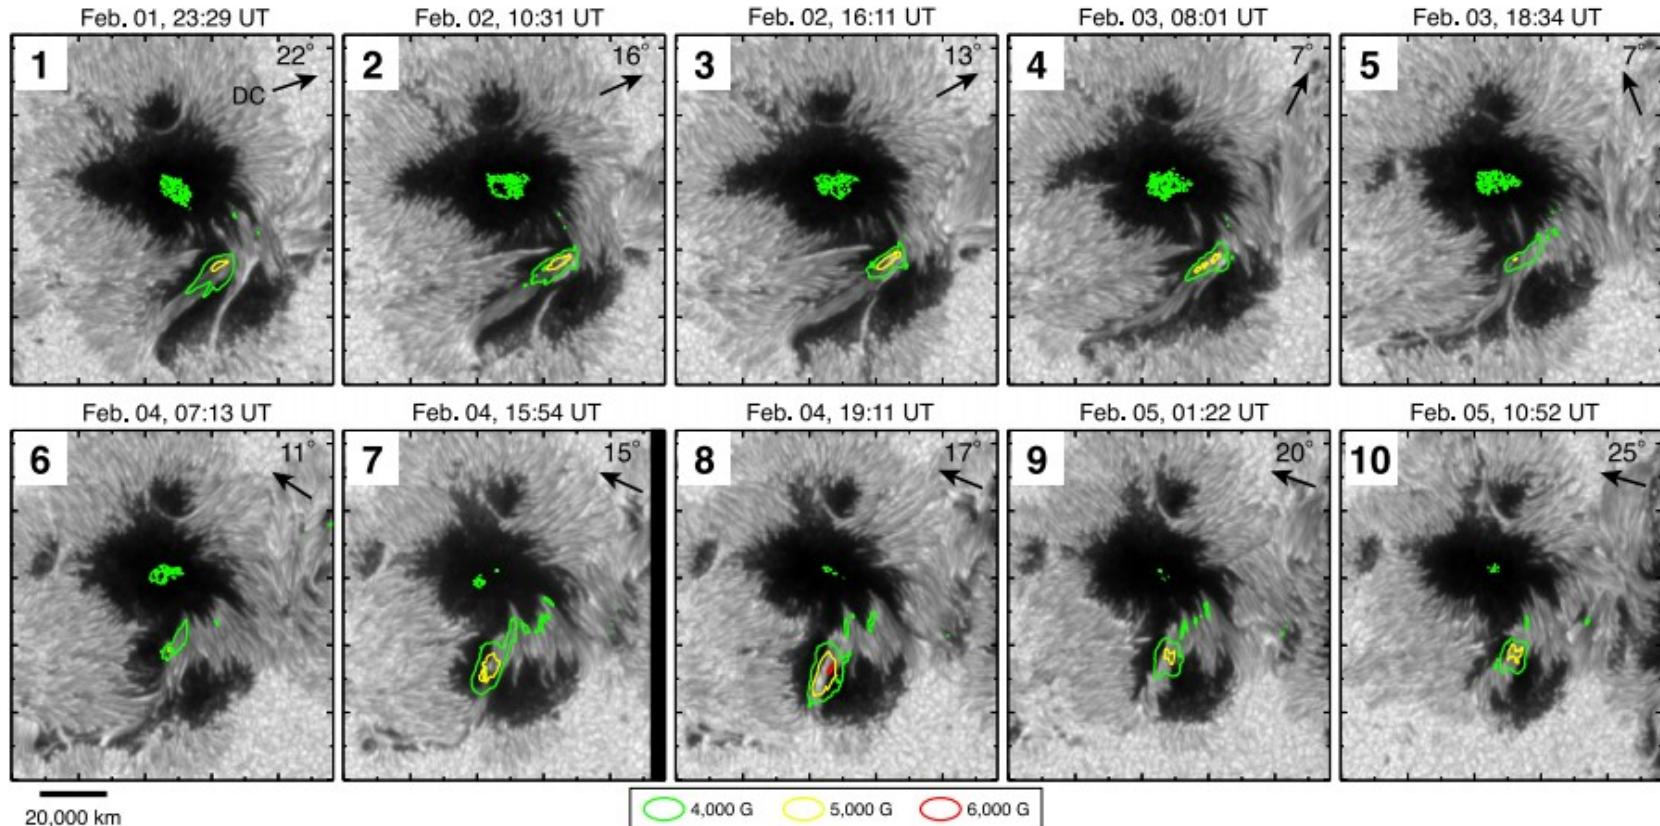

Figure 2. Time series of the continuum images of the sunspot. Contours indicate the magnetic field strength (green, yellow, and red for 4, 5, and 6 kG). Each panel shows the direction of and the angular distance to the disk center at the center of the field of view.

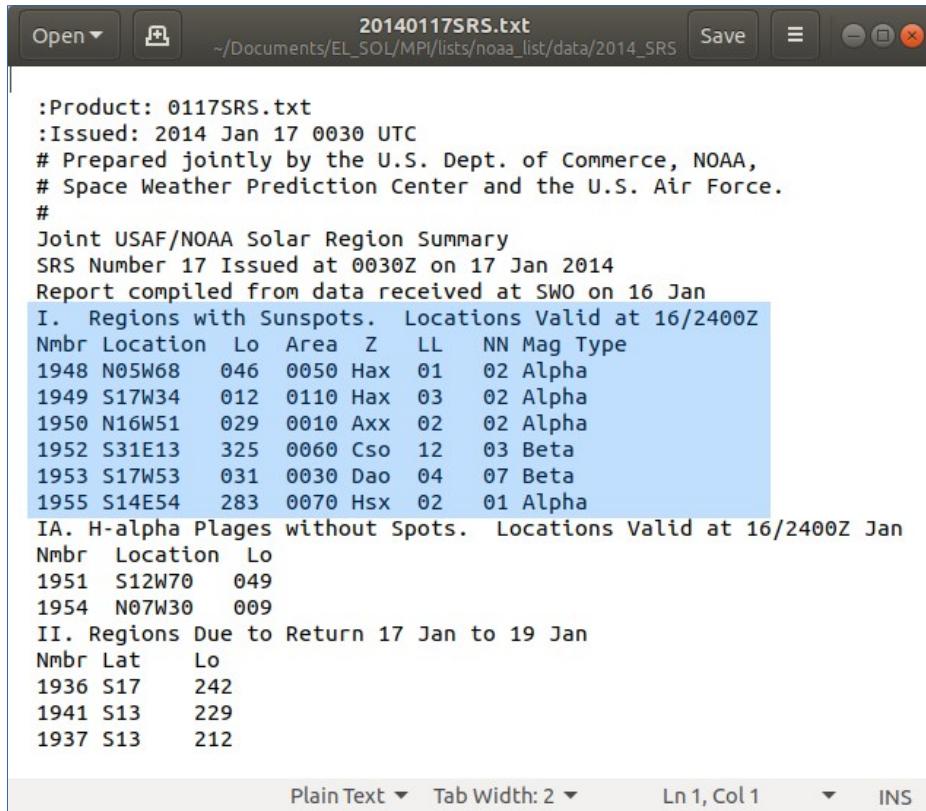

Okamoto & Sakurai 2018

Šta zapravo tražimo?

- Verovatno velike kompleksne aktivne regije (AR) sa pegama
- Verovatno δ -tip pega
- Verovatno AR koji imaju "light bridge"
- Verovatno AR koji imaju jake ponore materije ("downflow")
- Trebaju nam posmatranja sa Hinode
 - Hinode: rezolucija 0.16" ili 0.32", ali ciljana posmatranja
- Prolazni fenomen, najbolje ako je praćena evolucija

Pa, gde početi?

Nekakva baza pega?

MPI za istraživanje Sunčevog sistema

- **O institutu:**
 - Sun and Heliosphere
 - Solar and Stellar Interiors
 - Planets and Comets

→ Mogućnosti za praksu,
MSc i PhD (IMPRS)
- **O životu na institutu:**
 - Odjednom za sve imate vremena.
 - Atmosfera i mentorи su (uglavnom) dobri.
- **O projektu:**
 - Imala sam neki cilj koji ovaj projekat nije ispunio.

Hvala na pažnji!
